Companies that sell tests for the novel coronavirus have already responded to the pandemic's demands by multiplying production, sometimes spurning their administration previously.

The number of companies that test for the virus is rapidly increasing, with some even changing their business models to meet the new demand. The most well-known companies include Abbott Laboratories, which sells its own test, and Boston-based DxAlly, which has developed a rapid test for the virus.

The companies have also faced criticism for the high cost of their tests. In March, 3M was caught using deceptive advertising to promote its N95 masks, which were in high demand and essentially sold out by the end of the month. The company eventually agreed to stop using the term "virus protection" in its advertising.

In California, 552 people have died of Covid-19 in the past seven days, marking the highest single-week total since the pandemic began. The same is true for Texas, where 612 people have died. The number of deaths in the state is expected to continue rising as the virus continues to spread.

In Arizona, the number of deaths is also rising, with 332 people dying in the past week. The state has been hit hard by the virus, with more than 200,000 confirmed cases and 9,000 deaths.

In New York, the number of deaths is also rising, with 350 people dying in the past week. The state has been hit hard by the virus, with more than 200,000 confirmed cases and 9,000 deaths.
